The Strike Plate can be adjusted to minimize side-to-side slop in the latch by properly orienting the Backup Plate to the Strike Plate. The Backup Plate contains a bent lip, which must be oriented up when used with the Archetype or Maxi latch.
There are (3) sets of tapped holes in the Backup Plate that allow for different latch types. For the Archetype or Maxi latch, the Strike Plate should be attached to the center set of holes. With this set up you should have approximately 1/8" of side-to-side slop.
